Video transcript

Creating compelling presentations

Kanja is a marketing manager for a fast food restaurant. The restaurant has struggled to grow and be competitive with bigger chains. The restaurant owners want to know how to grow their business. So, they've asked Kanja to analyze the restaurant's data to determine how to increase sales and attract more customers. They've also asked her to share what she's found in a compelling presentation to help them understand what changes they need to make.

Creating a compelling presentation for a data story starts with the question, and then data is examined to answer the question. Kanja asks: How can their restaurant stand out from other restaurants? She'll use that question to dictate what data she uses and to plan the story she'll tell the owners in her presentation.

Finding data to answer her question isn't a simple process. She has to determine what data is important. She also has to figure out how to use it. Then, she repeats the analysis process several times.

After some analysis, she starts to see a trend in healthy food. The data reveals that many other restaurants' patrons are health-conscious and want healthier menu items. She finds that for the restaurant to stand out from other fast food restaurants, they need to offer healthier menu items. She uses this data to tell the story to the owners about their customers' desire for healthier food.

With the story in mind, she chooses visualizations to show the owners what she's found. In a compelling presentation, visualizations depend on the data and story. Kanja uses a bar chart to show what customers are interested in.

In a survey, customers rated different foods the restaurant offers or plans to offer. The x-axis represents the level of customer interest or satisfaction, and the bars on the chart represent the level of interest or satisfaction for current menu items and healthier items. She uses a bell curve to show which items customers purchase more. She plots the data on a graph with the x-axis representing the number of items and the y-axis representing the food customers purchase. She determines that customers purchase healthy foods more often as a side item with the main meal or as the main meal. Next, she selects the most important information, organizes her findings, and ensures that her data story flows smoothly.

When Kanja presents her data story to the restaurant owners, she includes her question and the purpose of the analysis. She shows that customers prefer healthier menu items and are willing to pay

more for them. After Kanja's presentation, the restaurant owners agree to add healthier menu options to their menu. As a result, the restaurant sales increased significantly, and they attract new customers looking for healthier menu options. Because Kanja created a compelling presentation, the restaurant owners are able to take data-driven measures to help their business grow.
